

Campbell Tuneable Chanter Review

www.schoolofpiping.com

This chanter has arisen from the collaboration between McCallum Bagpipes and piper/inventor, Kyle Campbell. Drawing on McCallum Bagpipes' experience of producing top quality instruments and some radical thinking from Kyle, this chanter will provide any piper with quick tuning and a sweet, bright, high quality sound, with a very true scale straight out of the box.

Campbell tuneable chanter with unique tuning screw

A tuning screw on the bulb of the Campbell Chanter allows for quick tuning whilst you play your pipes. You will not even need to stop your instrument. The solution to tuning a bagpipe chanter very quickly has arrived. Now you can tune your chanter very quickly by simply turning the tuning screw to raise or lower your reed – whilst you continue to blow your pipes. This is quite precise, although top hand notes as we know change more than the bottom hand when adjusting a reed. It is however a huge advantage in that it is quick to use and even better, you do not need to take the chanter out of the stock, exposing the reed to the outside air and obvious changes that take a while to settle again.

The Campbell Chanter is based on McCallum's Mark III design. With comfortable round holes, good finger spacing, and a true scale, this chanter presents a bright sound with very good projection and stability.

Internal workings of the Campbell Chanter

Characteristics:

- Bright.
- Good volume.
- Very true scale.
- Controllable Piobaireachd G.
- Very good stability with no notable faults.
- Easy to reed.
- Unique tuneable function.
